SMART PARKING SYSTEM

Division: P1-2

Group No: 9

Team Members:

Sr No	Roll No	Name
1	41	Jihan Gome
2	42	Ameya Goudar
3	43	Pooja Gunjekar
4	44	Aaditya Gupta
5	45	Aashna Gupta

Final problem Statement:

The project aims to develop a **sensor-based parking system** that efficiently detects and manages parking space availability. The system should automatically identify vacant and occupied slots using sensors, display real-time information to users, and minimize manual intervention.

Proposed Idea:

When a vehicle is parked in a slot, the ultrasonic sensor detects its presence by measuring the distance between itself and the object. If the distance is below a threshold, it marks the slot as “occupied.” This data is relayed to the central unit, which updates the display in real time.
